Quality Control

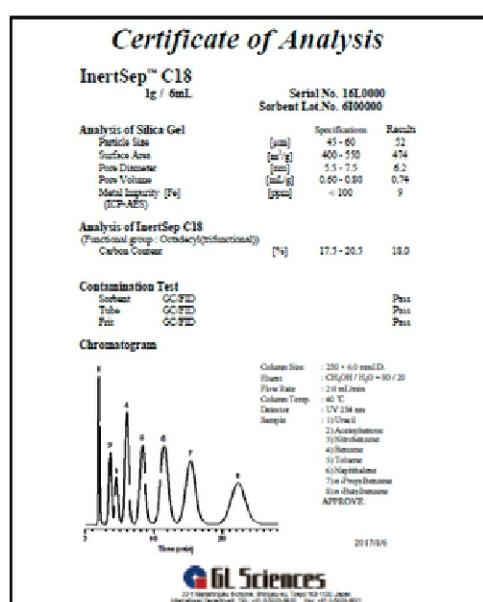

■ Quality Control

There have been significant advances in innovation in analytical instrumentation, making it much easier to perform trace analysis. However, no matter how well the instruments are developed, sample preparation and pretreatment are still inevitable. There is a wide variety of techniques available for sample pretreatment, such as mechanical grinding, dissolution and extraction.

This chapter describes the use of solid phase extraction (SPE), a sample pretreatment technique which is fast, clean and economical when compared with the traditional method of liquid-liquid extraction.

Systematic errors can greatly affect the overall accuracy and precision of analysis. To overcome these problems, solid phase extraction can be done using a range of automation technologies. Automation of sample pretreatment greatly improves the reproducibility, reliability and robustness of SPE. The reliability of SPE packing materials has also become increasingly important.

GL Sciences is committed to providing our customers with 'Excellent Products, Quick Delivery' together with 'Fast Technical Support'; giving you confidence in our products to achieve your goals.

● Quality Control of InertSep Products

The InertSep series is an original GL Sciences brand produced in our own factory through development, manufacturing, quality control and inspection. Our Fukushima Manufacturing factory has obtained the International Organization for Standardization ISO-9001 certification. All solid-phase extraction products are manufactured under strict quality control and widely used in the analysis of food and water samples. All products are inspected and only those which pass our stringent criteria are shipped to customers.

On request, we can provide a customization service and custom-made multi-sorbent beds in a cartridge.

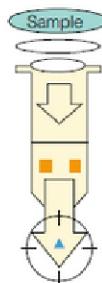

Objective of Solid Phase Extraction (SPE)

■ Objective of Solid Phase Extraction (SPE)

● Separation and Purification of Target Analytes

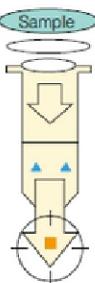

The principle of SPE is divided into the following two methods.

① Retaining the target analyte

Mainly used to concentrate target analytes in aqueous sample matrix.

② Retaining the sample matrix and letting the target analytes pass through

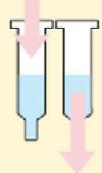

Used in simplification of complex sample matrix such as pesticide residues in crops and organic compounds in soil.

■ How to Select a Sorbent

One of the most important elements to achieve successful of solid phase extraction is the selection of a sorbent suitable for both the sample matrix and the target analyte.

The sorbent should be carefully selected by taking into account the chemical and physical properties of both the target analyte and the sample matrix. In addition, it is important to develop conditions that are optimal for retaining the target analyte, while removing the sample matrix, then selecting an elution solvent for maximum recovery of the target analyte.

Retentive Capacity of a Sorbent Compared to Sorbent Mass

* Bed volume is the quantity of the solvent necessary to replace the air trapped in the solid phase.
Void volume is equivalent to the bed volume

InertSep Series Sorbent Specifications

Polymer-based Sorbent Specifications

To conduct solid phase extraction, it is necessary to choose the sorbent best suited for the properties of your target compound and sample matrix. The advantages of polymer-based sorbent are the availability in the wide pH range and the absence of secondary interaction which can occur with silica-based sorbents.

Silica-based Sorbent Specifications

The silica-based sorbent materials are more cost-effective and have a higher physical strength compared with polymer-based sorbent materials. Silica offers a wide variety of separation mechanisms using a combination of primary functional group interaction with secondary interactions due to the nature of silica.

InertSep C2

Si-C₂H₅

| | |
|-----------------------|-------------------------|
| Average Particle Size | : 60 µm |
| Carbon Load | : 5.5 % |
| End-Capping | : Middle |
| Surface Area | : 450 m ² /g |
| Pore Volume | : 0.7 mL/g |
| Pore Size | : 6 nm |
| pH Range | : 2 – 8 |

InertSep C2 is silica-based sorbent modified with C2 groups for weaker non-polar interactions than C8. InertSep C2 is used for analytes that are too strongly retained on C8. With our high-level end-capping, cation exchange by the residual silanol groups is suppressed resulting in reduced adsorption of basic compounds.

InertSep VRA (Multifunctional Cleanup SPE Cartridge for Aflatoxins)

Total Aflatoxin Analysis

A number of mycotoxins are contained in natural food products. Among these, Aflatoxins produced by funguses such as *Aspergillus flavus* are carcinogenic to liver cells, and have attracted considerable attention in food safety.

InertSep VRA Series

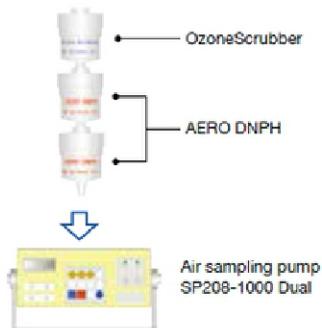

InertSep VRA series are multifunctional solid phase extraction cartridges for cleanup samples in complex organic matrices.

Feature

These multifunctional cartridges have the advantages of both reversed phase and ion exchange silica-based sorbents.

InertSep mini AERO series

Ex 1) How to use InertSep mini AERO

Note) Use the Ozonescrubber depending on the requirement

Ex 2) How to use InertSep mini AERO

InertSep mini AERO series are active samplers for the analysis of aldehydes and ketones in outdoor gas, car cabin and exhaust gas in compliance with: Offensive Odor Control Law, Clean Air Act, and EPA. There are four types: AERO DNPH, AERO DNPH-HR, AERO OzoneScrubber, and AERO SC, InertSep mini AERO series.

Features

InertSep mini AERO DNPH

This active sampler is packed with spherical silica coated with 2,4-Dinitrophenylhydrazine reagent for derivatization of aldehydes and ketones. The size of 120 µm spherical silica allows for high air permeability, resulting in high collection efficiency of the target compounds and low blank compared with irregular silica.

InertSep mini AERO DNPH-HR

This is newly developed and offers improved efficiency for acrolein collection, which is difficult to collect with the conventional DNPH cartridges.

InertSep mini AERO OzoneScrubber

Potassium iodide is used to remove ozone interference. It is known that the DNPH derivatives are decomposed by ozone, which affects the results. InertSep AREO OzoneScrubber is used in series with DNPH cartridge at its inlet side.

InertSep mini AERO SC

This cartridge is packed with polymeric packing material of strong cation exchange to remove unreacted DNPH.

Unreacted DNPH interferes with GC analysis, so is connected to the outlet side of DNPH cartridge.
