$\geq 5 \mu\text{m}$ Preparative HPLC Columns

From Productivity Comes Predictability

Why struggle with inconsistencies in column-to-column performance, unpredictable column lifetimes, lost samples, repeat purification runs, and poor scalability from small- to large-volume columns?

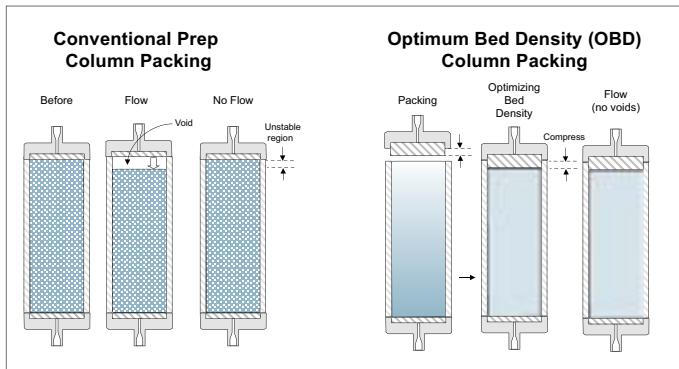

Increase your productivity through higher recoveries and longer column lifetimes.

With Optimum Bed Density (OBD) Preparative Columns, you can:

- Achieve fast, efficient, lab-scale separations, for greater throughput
- Directly scale from UPLC, UHPLC, or HPLC screening to lab-scale purification
- Select robust chromatographic particles designed for purification

The OBD Column Design

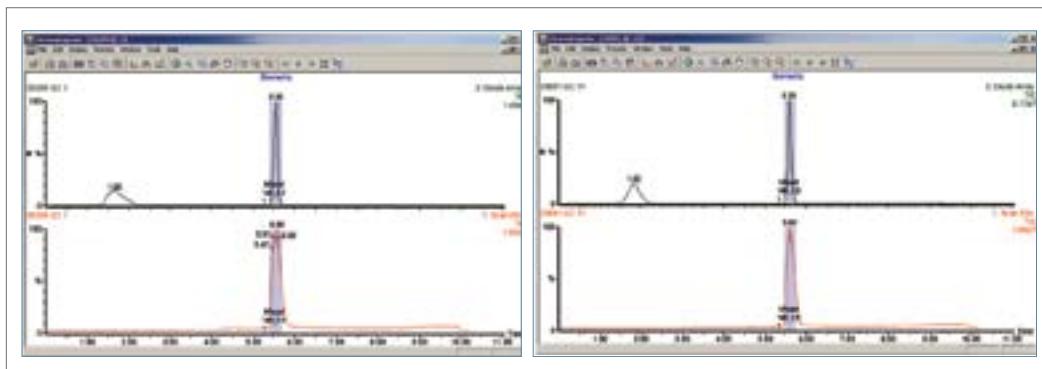

The OBD Preparative Column design and packing process results in predictable, uniform density profiles throughout the column. During the final capping process, our established procedures do not over compress or disrupt in any non-uniform way, eliminating the potential for voids.

COLUMN STABILITY AND RELIABILITY—LONG, PREDICTABLE LIFETIMES

The demand for rapid, high-purity, compound isolation assumes confidence in the integrity and stability of preparative columns. Complex, sparingly-soluble starting materials are often dissolved in strong solvents, such as DMSO. The combination of poor solubility and pressure shocks associated with large injection volumes of pure organic solvent are the primary contributors to early column failure and chromatographic bed collapse. The OBD design exhibits exceptional resistance to mechanical chromatographic bed failure and delivers consistent column-to-column performance, reducing cost by extending lifetimes.

Data From a High-Throughput Drug Discovery Laboratory

Data from a high-throughput drug discovery laboratory shows excellent peak shape after 7000 injections on an XBridge BEH C₁₈ OBD Prep Column, 130 Å, 5 μm, 19 × 50 mm.

HOW TO CHOOSE THE RIGHT OBD PREPARATIVE COLUMN

STEP 1

Once the analytical separation has been optimized, a loading study on the analytical column is performed to determine the capacity of the particular packing material. The large-scale separation should be identical to the small-scale separation, therefore the maximum sample load will be dependent upon the complexity of the analytical separation.

STEP 2

Determine how much mass you need to purify or isolate.

STEP 3

Use these simple equations to determine the required column size for purification.

Note: Preparative HPLC system maximum flow rate and backpressure need to be considered and can limit column size.

Scale-Up Factor

$$\text{Scale-up factor} = \frac{(\text{Diameter preparative})^2 \times \text{Length preparative}}{(\text{Diameter analytical})^2 \times \text{Length analytical}}$$

Example: Scaling up from a 4.6 × 150 mm column to a 19 × 150 mm column:

$$\text{Scale-up factor} = \frac{(19)^2 \times 150}{(4.6)^2 \times 150} = 17.1$$

Applying the scale-up factor, you can predict that an approximate range of 17 to 135 mg of sample could be applied to the larger (19 × 150 mm) column (packed with the same material as the analytical column). This range is based on an analytical column (4.6 mm I.D.) mass load of 1 to 8 mg.

Flow Rate

$$\text{Flow rate (prep)} = \text{Flow rate (analytical)} \times \frac{(\text{Diameter preparative})^2}{(\text{Diameter analytical})^2} \times \frac{\text{Particle size (analytical)}}{\text{Particle size (preparative)}}$$

The calculated flow rate may be used for the larger column to ensure the same linear velocity of the mobile phases as used in the analytical run. However, reasonable rates are based on column diameters. Systems will be limited by increasing backpressure with increasing column length and decreasing particle size.

Gradient Duration (GD)

$$\text{GD (prep)} = \frac{(\text{GD analytical}) \times (\text{Length preparative})}{(\text{Length analytical})} \times \frac{(\text{Diameter preparative})^2}{(\text{Diameter analytical})^2} \times \frac{(\text{Flow rate analytical})}{(\text{Flow rate preparative})}$$

MASS LOADING

Many factors affect the mass capacity of preparative columns. The listed capacities represent an "average" estimate of the total amount of mass per injection to be loaded on to the column.

Approximate Peptide Mass Loading Capacities (mg) for OBD Preparative Columns (Gradient Mode)

Length (mm)	Diameter (mm)				
	4.6	10	19	30	50
50	0.3– 0.6 mg	1.5– 3.0 mg	4– 9 mg	11– 22 mg	31– 62 mg
100	0.5– 1.0 mg	2.5– 5.0 mg	9 18 mg	22– 45 mg	62– 125 mg
150	0.8– 1.6 mg	4.0– 8.0 mg	13– 27 mg	34– 68 mg	93– 186 mg
250	1.3– 2.6 mg	6.0– 12.0 mg	22– 45 mg	56– 112 mg	155– 310 mg
Reasonable flow rate (mL/min)	0.9–1.8	4.5–9.0	16–32	40–80	111– 222 mg
Reasonable injection volume (μL)	20	100	350	880	2450

Capacity is:

- Higher for strongly retained material
- Higher for simple mixtures
- Lower where higher resolution is required
- Very strongly dependent on loading conditions
 - Limited by loading volume
 - Limited by diluent solvent strength

Approximate Small Molecule Mass Loading Capacities (mg) for OBD Preparative Columns (Gradient Mode)

Length (mm)	Diameter (mm)				
	4.6	10	19	30	50
50	3 mg	15 mg	45 mg	110 mg	310 mg
75	–	–	–	165 mg	–
100	5 mg	25 mg	90 mg	225 mg	620 mg
150	8 mg	40 mg	135 mg	335 mg	930 mg
250	13 mg	60 mg	225 mg	560 mg	1550 mg
Reasonable flow rate (mL/min)	1.4	6.6	24	60	164
Reasonable injection volume (μL)	20	100	350	880	2450

Reasonable flow rates are based on column diameter.

Systems will be limited by increasing backpressure with increasing column length and decreasing particle size.

Reasonable injection volumes are based on column diameter at a length of 50 mm with relatively strong solvents. Increased length is compatible with larger injections, but not proportionately so. Weaker solvents significantly increase injection volume.

Mass loading capacities for peptides and purifications depend strongly on the sequence and may be estimated at 5–20% of listed values.

Estimates for peptide mass load are broad because capacity depends on the solubility of the peptide in the mobile phase.

"These are excellent columns. They come in a variety of sizes to meet every need, we use mostly the 19 × 100 mm. These columns are great and meet our routine purification needs and give excellent efficiency and resolution for those more challenging ones. We find that the columns are very robust, ours can last years and many injections, in some cases, a good flush is all that is needed to get them back to optimal. Highly recommended."

"Waters application specialists help us to select the correct dimension of the (XBridge) column based on our application. On the receipt of the column, the application specialist was on site and helped us install and share his experience working with prep column. I am using this column almost every day and made more than 2000 injections with 10 mg/mL sample concentration and still, it works well for my application. I highly recommend this column and I am very happy with Waters products, their after sale support. The one thing that makes stand above all is their 90 days guarantee."

VERSATILITY AND SELECTIVITY

XSelect HPLC Columns offer the opportunity to scale separations from analytical to preparative, taking advantage of alternative selectivity through different column chemistries and methods specifying different pH scales.

XSelect OBD Preparative Columns are:

- Available as CSH C₁₈, CSH Fluoro-Phenyl, CSH Phenyl-Hexyl, HSS C₁₈, HSS C₁₈ SB, and HSS T3 column chemistries
- Designed for selectivity, improving the separation of closely eluting peaks
- Intended for isolation and purification, improving throughput with high-mass loading
- Ideal for rapid method development, reducing the time and cost required to develop screening methods

Columns for peptide purifications:

- Improve peak shape and mass loading using the QC-tested XSelect Peptide CSH C₁₈ Columns

APPLICATION AREA: Peptide Purification from Biological Samples

"The Waters XSelect line of columns are easily some of the best columns I have used for separations of peptides. The columns give reproducible results, can be effectively used under a wide range of conditions, and effectively separate almost everything I've attempted. The service by Waters and by the sales team was also top notch - they worked with me efficiently and were helpful in finding me the best column for my application. Thanks, Waters!"

Nova-Pak Preparative Columns

Nova-Pak HR, 6 µm, ultra-high-efficiency packing materials are available as shorter columns to facilitate separations - making it faster, lowering solvent consumption, and producing fractions of greater concentration. The preparative Nova-Pak HR material provides the same selectivity and retention characteristics as the analytical Nova-Pak 4 µm material. The Nova-Pak HR packing materials for preparative use are ideal for separating a wide range of compounds such as organic synthesis intermediates or natural products.

µBondapak/Bondapak and µPorasil/Porasil Columns

The popular µBondapak C₁₈ chemistry and µPorasil silica packing materials are offered in 10 µm particle size. Bondapak and Porasil are available in two particle sizes, 15–20 µm and 37–55 µm, providing easy transfer of chromatography methods and the means to optimize resolution, throughput, and cost. Existing 10 µm µBondapak or µPorasil chromatography can serve as a starting point for scale-up separations.

The preparative Bondapak HC₁₈ HA (high carbon load, high activity silica) is a highly carbon-loaded packing that differs in selectivity from that of the standard Bondapak packing materials. The higher carbon load on the silica surface typically results in a higher loading capability. Bondapak HC₁₈ HA is available in the 37–55 µm particle size.

The Porasil Silica family of packing materials provides a cost-effective means for scaling up to preparative processes. µPorasil 10 µm, Porasil 15–20 µm, and Porasil 37–55 µm can be scaled up to Prep Silica 55–105 µm columns.

Delta-Pak Preparative Columns

Delta-Pak packing materials are ideal for separating peptides, proteins, and natural products. Isolating and purifying a peptide is usually a multi-step procedure in which fractions from a first run are re-chromatographed on the same preparative column to obtain pure product. Delta-Pak packing materials are based on a highly stable, bonded, end-capped 5 and 15 µm packing. The 5 µm packing is available in analytical-scale dimensions for preliminary preparative chromatographic studies, peptide mapping, and fraction-purity assays. The chemistry characteristics of the packing materials are independent of the particle size.

Preparative Standards

HOW DO YOU KNOW YOUR CHROMATOGRAPHIC SYSTEM IS IN PROPER WORKING ORDER?

Quality Control Reference Materials (QC Reference Materials) contain mixtures of standards specifically chosen to provide an easy and reliable way to monitor the performance of any chromatographic system. Using a QC Reference Material, you can be assured that your column and system are ready to analyze your samples. Regular use of QC Reference Materials also provides an opportunity to benchmark your chromatographic systems and trend performance over time, making it easier to proactively identify problems and resolve them faster.

Troubleshooting Common System Problems Using Waters Neutrals Quality Control Reference Material application note	720004635EN

Chromatographic analyses are inherently complex. Variables such as mobile-phase composition, column type, and detection method influence their outcome. Waters has formulated specific QC Reference Material mixtures that account for these variables while testing the performance of chromatographic columns and systems.

Gas Chromatography Packings

Versatile PoraPak gas chromatography column packing materials simplify the analysis of many complex compounds, from atmospheric gases to organics. Consisting of polymer beads, these unique packings are chemically and physically stable. Consistent particle size, porosity, and surface area ensure analytical reproducibility. The columns also provide unequalled separation capability with high resolution and low, constant retention volumes.

VERSATILITY FOR SPECIALTY APPLICATIONS

To optimize separation of even the most complex matrices, PoraPak packing materials offer several physical and chemical variations.

Special characteristics of Waters' unique GC packings include:

- Fast analysis, with compounds eluting in distinctive bands with no tailing
- The ability to sustain elevated temperatures, permitting temperature programming without adverse effects to retention, reproducibility, and column life
- The ability to accommodate large sample loads required for preparative and trace analysis while maintaining characteristically high column efficiency
